

### Legends for the maps

From left to right, SSRH map, USDA-MARC linkage map and IMpRH map are shown. The corresponding markers of each map are connected with the lines. The number under the vertical line of the SSRH map shows the total length (cR) of each chromosome. The makers on the same line and in the boxes of the USDA-MARC map cannot decided the order, because no recombination occurred.

We would like to acknowledge Dr. G. Rohrer and Dr. D. Milan for giving permissions to use USDA-MARC linkage map and IMpRH maps on this web site
